This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Eas anoticis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, cantiantenic, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antitrheumatic, nephrotropic, antilnfertility, neuroprotective, antistrefucelerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent disease associated with the Fas/Fas ligand system, especially systemic capptosis by binding to cell surface Fas or inhibit it by competitive computed in thibition of ligand binding. (I) are used to treat and/or prevent disease, solorgen's syndrome, pernicious or hypoplastic versus host disease, soleroderma, Goodpasture syndrome, Crompasture syndrome, Computed and System, capped and System, and is a sease, soleroderma, sterility, myssthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin disease, autoimmune hemolytic anemia, sterility, myssthenia gravis, cardiomyopathy, glomerulonephritis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic, and transplant rejection. (I) selectively cells in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, 1.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody reponse. This sequence represents way was antibody light construction.
                                                                                                                                                                  New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

Claim 3; Page 156-157; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

complexis in cells with a normal system, by binding to Fas on the cell surface, and prevents

apoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, dermatological, immunosuppressive, thyromimetic,

antirheumatic, nephrotropic, antilnfertility, neuroprotective,

contiarterioscleroric, cardiant and hepatropic activity. (I) induce

antirheumatic, nephrotropic, antilnfertility, neuroprotective,

contiarterioscleroric, cardiant and hepatropic activity. (I) induce

apoptosis by binding to cell surface Fas or inhibit it by competitive

complexis by binding to cell surface Fas or inhibit it by competitive

converses associated with the Fas/Fas ligand system, especially systemic

complexishmentosus, Hashimoto disease, remustoid arthritis, graft

versus host disease, Sjorgen's syndrome, pernicious or hypoplastic

consmita, Addison's disease, thrombopenia purpura, insulin

consmita, Addison's disease, thrombopenia purpura, insulin

constitute apoptosis, and antility, allergy, arteriosclerosis, myocardits,

cardiomyopathy, glomerulonephritis, hepatility (fulminat, chronic, viral

contine apoptosis in normal cells but selectively induce it in abnormal

colls. They bind to both human and murine Fas, so can be evaluated in

murine disease models. (I) act on the active site of Fas, i.e. they mimic

the native ligand, do not induce liver disease, and have reduced risk of

the native ligand, antilody light chain construct designated Leu inducing a human anti-murine antibody response. This sequence represents

a humanised anti-Fas antibody light chain construct designated Leu invention.

The products of the invention have anti-inflammatory, antidiabetic, anti-allergic, anti-arthritic, antiviral, immunosmodulatory, dermatological, immunosuppressive, thyromimetic, antintremantic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerctic, cardiant and hepatropic activity, (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent

                                                                                                                        disease, autoimmune hemolytic anemaia, soutpasuria syndiance, commanda, moultiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B; C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine fass, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody light chain construct designated Leu 2 which is described in the method of the invention.
diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematcosus, Hashimoto disease, rheumatcold arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

chain of murine anti-human Fas monoclonal antibody HEE7A.

Humanisation of the murine sequence (see AAM83042) entailed making DIE, P47A, K49F, H80S, P81R, V82L, B84P, A87F, T89V and R107K amino acid substitutions; these residues are conserved in the human light chain (kappa chain). Host cell Escherichia coll pHSHHS SANK 70398 harbors plasmid pHSHHS carrying a fusion of fragment of the humanised PDHH type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6274 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAM83031-37), like native HFE7A, are capabble of inducing apoptosis in abnormal cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, Sjogren syndrome, pernicious anaemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arthritis, autoimmune haemolytic anaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thromobenia burpura and insulin-dependent disbetes), allergies, attopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy. glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-Fas antibody; monoclonal antibody HFE7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains anti-Fas antibody \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, anti-allergic, anti-arthritic, antiviral, immunomodulatory, dermatological, immunosuppressive, thyromimetic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

antirheumatic, nephrotropic, antiinfertility, neuroprotective,
antiarteriosalerotic, cardiant and hepatropic activity. (I) induce
apoptosis by binding to cell surface Fas or inhibit it by competitive
inhibition of ligand binding. (I) are used to treat and/or prevent
diseases associated with the Fas/Fas ligand system, especially systemic
lupus errythematosus, Hashimotto disease, rheumatoid arthritis, graft
versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, starility, myasthenia gravis,
antiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
(B, C or D) or alcoholic), and transplant rejection. (I) selectively
inhibit apoptosis in normal cells but selectively induce it in abnormal
cells. They bind to both human and murine Fas, so can be evaluated in
murine disease models. (I) act on the active site of Fas, i.e. they minic
the native ligand, do not induce liver disease, and have reduced risk of
inducing a human anti-murine antibody response. This sequence represents
the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

This is the amino acid sequence of the HH type humanised light chain of murine anti-human Fas monoclonal antibody HFB7A. Humanisation of the murine sequence (see AAM8304) entailed making P47A, K49R, H80S, PBR, W82L, E84A. E85A, B87F and T89V amino acid substitutions; these residues are conserved in the human light chain (separate) and passent and the human light harbors plasmid pHSGHHY carrying a fusion fragment of the humanised HH type HFB7A light chain and DAN encoding the region of human immunoglobulin Rappa chain, and is deposited as PERM BP-6073 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFB7A (see AAW83031-37), like native HFB7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such liseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, green, sieger and syndrome, pernicious anaemia, Addison's disease, rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, attended and properties, myocarditis, cardiomyopathy, glomerulonephintis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14772-B14774 and ABB14777-B14778

cc Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic complexes a specially systemic system-actives anemia, Addison's disease, rheumatoid arthitis; graft or anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, anemia, Addison's disease, thrombopenia purpura, insulin dependent diabletes mellitus, allerry, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they minic mutrhe disease models. (I) act on the active site of Fas, i.e. they minic inducing a human anti-murine antibody response. This sequence represents a humanised anti-Fas antibody response. This sequence represents the method described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           QQKPGKAPKLLIYAASNLESGIPSRFSGSGSGTDFTLTISSLQPEDFATYYCQQSNEDPR 120

This is the amino acid sequence of the HM type humanised light chain of murine anti-human Fas monoclonal antibody HFE7A.

Humanisation of the murine sequence (see AAM83042) entailed making P47A and K49R amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell E. coll pHSGHM17 SANK 73597 harbors plasmid pHSGHM17 carrying a fusion fragment of the humanised HM type HFE7A light chain and DNA encoding the region of human immunoglobulin kappa chain, and is deposited as FERM BP-6072 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW83031-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells. Captressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune classase, graft versus host disease, Sjoren syndrome, pernicious anemia, Addison's disease, Sloren syndrome, pernicious anemia, sterility, mvarthoria ransis multiple solences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibodies and proteins bind conserved epitope of Fas antigen - used to evaluate drugs in animal models and to treat Fas-associated diseases e.g. autoimmune disease, allergy, atopy, arteriosclerosis, myocarditis, hepatitis and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thromboenia burpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Jun O, Kimihisa I;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences AAB14772-B14774 and AAB14777-B14778 represent the light chains of several humanised HFE7A-derived anti-Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.

disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent disbetes mellitus, allery, arterioselscosis, myosarditis, cardiomyopathy, glomerulonephitis, hepatitis (fulminat, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-nurine antibody response. This sequence represents a humanised anti-Fas antibody HEFAA light chain HM type which is used in the method described in the invention.
molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                 immunomodulatory, dermatological, immunosuppressive, thyromimetic, antirheumatic, nephrotropic, antiinfertility, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (1) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (1) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     QQKPGKAPKLLIYAASNLESGIPSRFSGSGSGTDFTLTISSLQPEDFATYYCQQSNEDPR 120

chain of murine anti-human Pass monoclonal antibody HFEFA.

Humanisation of the murine sequence (see AAW83042) entailed making DIE, P47A, K49R and R107K amino acid substitutions; these residues are conserved in the human light (kappa) chain. Host cell Escherichia coli pHSHM2 SANK 70198 harbors plasmid pHSHM2 carrying a fusion of the humanised PDHM type HFEFA light chain and boosited as FERM BP-6272 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFEFA (see AAW83031-37), like native HFEFA, are capable of inducting Apoptosis in abnormal cells. Cells. The humanised antibodies are used to evaluate, in animal cells. The humanised antibodies are used to evaluate, in animal cells. The humanised antibodies are used to evaluate, in animal cells. The humanised antibodies are used to evaluate, in animal cells. The humanised set involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, craft versus host disease, soleroderma, Goodpasture syndrome, Crohn's disease, rheumatoid arrahist, autoimmune haemolytic anaemia, sterility. Myasthenia gravit militins autoimmune haemolytic anaemia. sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulin-dependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed). This is the amino acid sequence of the PDHM type humanised light

Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autolimune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; light chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preventive or treating agent for the diseases caused by an abnormality in the Fas/Fas ligand system e.g. autoimmune diseases, contains
